Endpoint Security Basics

Synthetic internal training document · Department: IT Security · Revision: 1.0

Security agent status

Open the company endpoint-security application and check whether protection is active and the last update is recent. Do not disable protection to install software or troubleshoot performance.

Threat alert

Do not dismiss or quarantine files manually unless the security procedure directs you. Record the alert name and time and contact IT Security. Avoid copying suspected malicious files into email or chat.

Lost device

Report a lost or stolen company device immediately with the asset ID, last known location and time. IT administrators will follow the approved remote-lock or wipe process.
