Corporate VPN Setup Guide

Synthetic internal training document · Department: Network Support · Revision: 1.0

Before setup

Use the company-managed laptop and a working internet connection. Confirm the employee account is active and has remote-access permission. Install only the VPN client supplied by the IT software portal. Never send passwords or one-time codes to support staff.

Connect to VPN

Open the approved VPN client, select the Corporate profile, and sign in with the company account. Complete the approved multi-factor authentication prompt. Wait until the client reports Connected. Open the internal portal in a browser after the tunnel is established.

VPN-204

VPN-204 means the client could not complete the corporate gateway connection in this synthetic training knowledge base. Check internet access first, confirm the Corporate profile is selected, verify the device date and time, and retry once. If it persists, capture the client log and contact Network Support. Do not change gateway addresses manually.

Connected but internal apps fail

Confirm the VPN client still shows Connected. Disconnect and reconnect once. Check whether the internal portal hostname is typed correctly. If public websites work but all internal services fail, record the time, VPN profile and client status, then contact Network Support for DNS or access-policy investigation.
