Workstation Backup and Restore

Synthetic internal training document · Department: IT Operations · Revision: 1.0

Check backup

Use the company-approved backup client to review the last successful backup time. Keep the laptop online during scheduled backups. Report repeated failures with the displayed error and device asset ID.

Restore a file

Use the approved backup portal to locate the file and select the required restore point. Confirm the destination before restoring. If the file is business-critical or the restore point is unclear, ask IT Operations for assistance.

No backup available

Do not install third-party recovery utilities. Stop writing new data to the affected drive if data loss is suspected and contact IT Operations promptly.
