Corporate Network Troubleshooting

Synthetic internal training document · Department: Network Support · Revision: 1.0

No network connection

Check whether other nearby employees have the same issue. Verify Wi-Fi is enabled and the correct corporate SSID is selected. Toggle Wi-Fi off and on once. If using Ethernet, check both cable ends and the dock connection. Record the device name, location and time of failure.

Connected but no internal access

Confirm the employee is on the corporate network or connected to the approved VPN. Test a known internal service and a public website separately. If public access works but internal access fails, record the exact hostname and error. Do not bypass network security controls.

Intermittent connection

Record the times when disconnects occur and whether the device is stationary or moving. Check whether multiple devices in the same area are affected. Avoid changing adapter advanced settings without IT approval. Send timestamps, Wi-Fi network name and device asset ID to Network Support.
