Approved Software Installation

Synthetic internal training document · Department: IT Operations · Revision: 1.0

Install from company portal

Open the company software portal while connected to the corporate network. Search for the approved application name and verify the publisher shown in the portal. Select Install and wait for completion. Restart only if the installer requests it. Do not download cracked or unofficial installers.

Installation fails

Record the application name, version, exact error text and time. Confirm there is enough disk space and that the device has restarted after pending updates. Retry once from the company portal. If the same error appears, attach the installer log and contact IT Operations.

Request new software

Submit a service ticket with the business reason, application name, vendor and required access level. Software requiring a license or elevated permissions must be approved before installation. Do not share administrator credentials with employees.
